## Chapter I Equipment Information

### 1.1 Product Brief

ACOM516 VoIP Gateway is a multi-functional and high performance product, which is mainly used for call termination (VoIP to Mobile) and origination (Mobile to VoIP). It can enable to make 16 calls simultaneously. It is based on SIP and compatible with Asterisk, 3CX, Elastix, IPPBX, VOS, VPS operating platform.

ACOM516 VoIP Gateway also can be used as a Network SMS modem which supports SMS sending, receiving, group sending. It has flexible HTTP/SIP API for SMS service. Customers can develop SMS server easily by the API.

ACOM516 VoIP Gateway supports GSM, CDMA and WCDMA network (one gateway one network). There are 3 modes in this series gateway: ACOM516-16, ACOM516-64 and ACOM516-128, the SIM capacity in these 3 modes are different.

### 1.2 Product Application

Figure 1.2-1 Product Application

## 1.3 Product Appearance

### Back Panel

Figure 1.3-1 Back Panel

Description of the front panel(from left to right):

- 1 Ground connection
- 1 reset button (press RST button about 10s will restore to factory settings)
- 1 Power Interface (DC 12V 5A)
- 2 Network Interface (LAN and WAN, RJ45)
- 1 Console Interface (USB to Serial, Baudrate 115200)
- 16 Antenna Connector

### Front Panel

Figure 1.3-2 Front Panel

Description of the front panel(from left to right):

- 64 SIM slots (4 SIM cards per channel)
- 1 Power light (indicate the status of the power connection)
- 64 LED lights (indicate the status of SIM cards)
- 2 fans

LED Status	SIM Status
Blind	No SIM/SIM Ready
Green and No-flash	SIM is calling
Flash(100ms)	SIM is locked by device or operator
Flash(500ms)	SIM is No Balance(when enable Ejoin billing system)
Flash(1000ms)	SIM registered failed

Table 1.3-1 LED Indicators

## 1.4 Special Features

- Support G729a/b/e,G723.1,G.711 A/U law, iLBC auto-selecting
- EBO (Ejoin Bandwidth Optimization)
- Proxy Encryption Solution for IP Block
- Support SIM Pool
- VPN (PPTP)
- SIM Card Rotating
- Base station intelligent switching/locking
- IMEI modification
- SMS and USSD API
- ERMS (Ejoin Remote Management System)
- Port Inter-Calling
- Fake ringback
- Call waiting
- Support call back
- Auto-recharge
- MNP
- State notification(CDR)
- Call Duration Limitation
- Dial Plan/Prefix Inward Translation/Intelligent Routing
- Web Browser: Firefox/Chrome /IE/Opera

## 1.5 Specification

Model	ACOM 516-64
Number of Channels	16 Channels
Frequency	GSM: 850/900/1800/1900MHz CDMA:800/1900MHz WCDMA:850/900/1800/1900/2100MHz

SIP Specification	SIP/2.0 RFC3261 Session Timer RFC4028 STUN
Network Protocols	DHCP/PPPoE/VPN(PPTP) NTP Telnet/HTTP/FTP/TFTP Encryption:Ejoin,VOS2000,RC4,XOP.Base64
Telephony Features	Hot-line call ,Dial plan, Speed dial, Phone book, CDR, LCR, White/Black list
Telephony Signaling	DTMF tone detection/generation DTMF relay: in-band, RFC 2833 and SIP info Call forward: unconditional, no answer and busy N-way conferencing Caller ID display/generation, Mobile Number Portability
Voice Capability	Voice codecs:G729a/b/e,G723.1,G.711 A/U law, iLBC Echo cancellation Silence suppression & detection(VAD, CNG) Adaptive jitter buffer Volume adjustable IVR customized
Number of Ports	1 WAN 10/100Base-T ethernet(RJ-45 connector) 1 LAN 10/100Base-T ethernet(RJ-45 connector) 1 Console(USB)
LED	1 Power and 16 groups of card online and running status indicator
Power Supply	100-240VAC, 50 - 60 Hz IN, 12V/5A OUT
Operating Environment	Operating temperature: 0 - 50 ℃ Operating humidity: 10 – 90%RH
Warranty	12 Months

Table 1.5-1

## 1.6 Mobile Features

- SMS Send, Receive and Forward (GSM/SIP/HTTP)
- SMS Inbox
- AT Command, USSD
- SMS Format: PDU/TXT
- PIN Code Management
- CDMA Delay Answer
- GSM Polarity Reversal
- Carrier Selection
- Caller ID Hidden (need SIM Card support)

## Chapter II Equipment Installation

### 2.1 SIM Card Placement

Insert SIM cards like the figure 2.1-1. The SIM cards should be mini-SIM (2FF).

Figure 2.1-1 SIM Card Placement

### 2.2 Antenna Installation

The external antenna should be installed vertically always on a site with a good wireless signal. It is strongly recommend that you choose the long antenna.

Figure 2.2-1 Antenna Installation

## 2.3 Network Connection

Plug Ethernet line into gateway WAN port, and then connect the other end of the Ethernet line with switch or router. Note: Do not use LAN port, LAN port is useless.

Figure 2.3-1 Network Connection

## 2.4 Power Connection

Connect the small end of the power cable to the power input on the back panel, and plug the other end of the cable into a 220V power outlet.

Figure 2.4-1 Power Connection

## 2.5 Serial Connection

Connect one side of serial cable to the console port on the back panel, another side to computer USB port.(Don't need connect it normally)

Figure 2.5-1 Serial Connection

## Chapter III Web Settings

### 3.1 Login

Open the web browser and type the IP address. If it is the first time you login the gateway, please use the default settings below:

IP Address: <http://192.168.1.67>

Account: root

Password: root

Figure 3.1-1 Login web

### 3.2 Basic Settings

#### WAN Settings

There are three types of WAN port IP: Static, Dynamic and PPPoE. (Default static IP is 192.168.1.67). You can also change the wan settings when get a new device. If you want to access in this default IP, your local PC need a same network segment 192.168.1.xxx.

Figure 3.2-1 WAN Settings

Items	Description
WAN Type	Static IP: manually set up gateway IP. Dynamic IP: automatically get IP from local network. PPPoE: need ISP offer the account and password. Use this mode when there is no router in the local network
WAN IP	The WAN IP address of gateway
IP Mask	The subnet mask of gateway
Default Gateway	Default gateway IP address. Example: router IP.
DNS Gateway	Domain name server IP address. Example: 8.8.8.8.

Table 3.2-1

### SIP Server Settings

This is the gateway settings for connecting with softswitch or server, such as VOS, VPS, IPPBX and Asterisk.

Figure 3.2-2 SIP Server Settings

Items	Description
Protocol Mode	There are two protocol modes: registration and point to point. Note: point to point can be used only when gateway and server in the same LAN or both have public IP.
Encryption Method	There are two encryption methods: EJOIN and VOS2000. (Note: Choose “EJOIN” Encryption need to set proxy server and port first.)
SIP Server IP	The IP or domain name of softswitch which will send traffic to the

	gateway. For example: VOS IP.
SIP Server Port	SIP port of softswitch, default port is 5060.
Phone Number	The caller phone number for SIP client, it can also be regarded as the SIP port number which can be called.
Account	SIP registration account which is provided by softswitch. For example: the routing gateway ID on VOS.
Password	The password of SIP registration account.

Table 3.2-2

### 3.3 SIP Protocol

#### Running Parameters

Figure 3.3-1 Running Parameters

Items	Description
Protocol Mode	It is the same as that in Basic Settings. The modification here also apply to Basic Settings page.
Encryption Method	It is the same as that in Basic Settings.
SIP Server	It is the same as that in Basic Settings.
SIP Server Port	It is the same as that in Basic Settings.
Primary Proxy IP	Proxy server will receive requests from client, and make the signaling and media streams are able to penetrate the firewall. It is usually used when gateway can't registered with the softswitch because of network blockade.

Proxy Port	The proxy server port. Ejoin default proxy port is 25600.
Secondary Proxy IP	It is the same as primary proxy, don't need set it.
Expiration Period	Gateway will send a register request to the softswitch during every expiration period.
Multiple Port Support	Disabled: all 16 ports will be used one SIP account. Enabled: all 16 ports SIP account will be separate.
Use Phone Number	If the username is not the same with user id, enable it.
Receive All Calls	Disabled: only the SIP server address which is type in basic settings or phone book can send traffic to this gateway. Enabled: traffic from any server can send traffic to this gateway (same LAN or both gateway and server have a public IP). It's dangerous when eabled, hackers may send traffic to the gateway then steal SIM balance.
Drop Account Prefix	If it is enabled, it will remove the account prefix presented in callee number.
Auto Resp 183	If it is enabled, gateway will send 183-Session-Progress immediatley for a incoming INVITE.
Route By From	If it is enabled, gateway will only accept the call whose "From" header is matched. Note: if the gateway is just used as call termination, please disable it.
No Line Code	Gateway will send this SIP code as response to SIP server when no available line.
Custom User Agent	The User Agent header which is used in SIP message.

Table 3.3-1

## STUN

STUN (Simple Traversal of UDP through NAT) is a protocol for assisting devices behind a NAT firewall or router with their packet routing. If you have the STUN server, enable STUN support, fill the server IP and port (default port is 3478), then it will work.

**STUN** Collapse

STUN Support:  \* If enabled, support the media traversal for non-symmetric NAT.

STUN Server IP:  \* Fill your stun server ip if you have.

STUN Server Port:  \* The default port is 3478.

Figure 3.3-2 STUN Settings

## MNP

**MNP** [Collapse](#)

MNP Support:  \* If enabled, the server can select channel or change callee number.

Select Order:  \* ASC/DESC will try to ensure the load balance, but Random not.

Route:

Server URL:

Username:

Password:

Figure 3.3-3 MNP Settings

Items	Description
MNP support	Mobile Number Portability (MNP) enables mobile telephone users to retain their mobile telephone numbers when changing from one mobile network operator to another.
Select Order	When the traffic send to the gateway, it can select ascending order, descending order or random ports.
Route	There are two choices of route: 1. Route calls after manipulation. 2. Route calls before manipulation. Note: route calls by allow prefix, callee number prefix manipulation by inward translation.
Server URL	MNP server address
Username	MNP server username
Password	Password of the username

Table 3.3-2

## SIP Accounts

**SIP Accounts** [Collapse](#)

Port	Allowed Prefix	Phone Number	Account	Password	Status
1	<input type="text" value="070,075"/>	<input type="text" value="101"/>	<input type="text" value="test"/>	<input type="text" value="*****"/>	
2	<input type="text" value="077,078"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

9	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	

Figure 3.3-4 SIP Accounts Settings

Items	Description
Allowed Prefix	Intelligent routing, gateway will route calls by the allowed prefix. for example: channel 1 is with prefix 070 and 075, this channel will only accept the calls with prefix 070 and 075, others will not be routed to this channel. If allowed prefix is blank, it can accept any calls. If all prefixes don't match, the call will be rejected.
Phone Number	When enable route by from, the channel will only accept the call which caller ID is input in phone number.
Account	SIP registration account.
Password	The password of SIP registration account.
Status	The status of registration. When gateway is registered with softswitch, it will show ready.

Figure 3.4.2-2 Base Stations Settings

Items	Description
Port NO.	Gateway channel, starts from 1 to 16.
Base Selection	Auto: every channel will select the base station automatically. Poll: base station will switch during every switch period, if set a base station in white list, it will be locked in this channel.
Base station	It will show the base station
White List	The base station white list, if you just put one base here and select “poll”, this channel will lock the base station.
Black List	The base station can't be used if put in black list.
Operations	Refresh the base station information.

Table 3.4.2-2

### 3.4.3 IMEI Settings

IMEI means International Mobile equipment Identity, it is a 15-digit number. The gateway can do IMEI modification, it can protect SIM from blocking. With the function, you can do static IMEI or dynamic IMEI.

Modify IMEI : Specify Prefix ▼

**Port IMEI** ▲ Collapse

Port	IMEI	A	B	C	D
1	863835021317644	865	865	865	865

You can click “Add New” button to add a new dynamic IMEI list, this list includes initial IMEI value of IMEI group and the size of IMEI group. click “Delete” will delete a exist IMEI list, if you want to change the settings of dynamic IMEI list, please click “Edit” button.

### 3.4.4 PIN Settings

PIN means personal identification number, it just like a password of SIM card, it can help to prevent SIM card from being stolen and improve security. Most SIM cards don’t have PIN code. If a SIM card is with PIN, you need input PIN code in corresponding slot and enable “PIN Unblock”, then the SIM card will work.

Reset When Switching:  Enable \* Reset the condition when switching to next SIM card.

Connected Calls:

Locking Duration:  \* Seconds, 0 means no lock while -1 means permanent lock.

---

**Accumulated Calls Checking**

Enable or Not:  Enable

**Figure 3.4.7-2 Locking Card Conditions**

We take “consecutive failed calls checking” for example to explain the lock/switch function.

Items	Description
Enable or Not	If it is enabled, the consecutive failed calls will be used as a condition for system to check.
Reset When Switching	This condition will be recalculated next time when it is switched by other conditions. For example:
USSD Query	After switch to next SIM, the next SIM will send USSD query command first.
Failed Calls	The maximum number of consecutive failed calls on this SIM card. If the number of consecutive failed calls exceeds this value, the card will be locked if this condition is enabled.
Locking duration	The duration of locking. 0 means no lock while -1 means permanent lock.

**Table 3.4.7-1**

If the SIM card is locked by gateway, it will show , it means locked by device. And you will also see the Description on running status >> call status page.

Lock/switch card conditions	Description on call status page
SIM Online Time Checking	Switch timer fired
Accumulated Call Duration Checking	Talk dur expired
Accumulated Connected Calls Checking	Talk num expired
Accumulated Calls Checking	Call num expired
Consecutive Failed Calls Checking	Failed call num expired
Consecutive No-Alert Calls Checking	Noalert num expired
Consecutive No-Answer Calls Checking	Noanswer num expired
Consecutive No Carrier Calls Checking	Nocarrier num expired
Consecutive Short-Duration Calls Checking	Shortdur num expired
Accumulated SMS Count checking	SMS num expired
Accumulated Failed SMS Count Checking	Failed SMS num expired
Consecutive Failed SMS Count Checking	Con-failed SMS num expired

Table 3.4.7-2

### 3.4.8 Port Inter-Calling

Port inter-calling is a good solution for protecting SIM from blocking. It's a human behavior feature.

**Basic Settings** ▲ Collapse

---

Port Inter-Calling:  \* If enabled, device will enable the feature by following conditions.

Send SMS:  \* If enabled, the callee will send a SMS to caller before inter-calling.

Min Call Duration:  \* Seconds

Max Call Duration:  \* Seconds

Figure 3.4.8-1 Basic Settings

Items	Description
Port Inter-Calling	The function will work if it is enabled. (need to set SIM number for every port first).
Send SMS	If it is enabled, the callee will send a SMS to caller before inter-calling
Min Call Duration	The minimum call duration when do port inter calling
Max Call Duration	The maximum call duration when do port inter calling. the call duration will between minimum and maximum duration.

Table 3.4.8-1

When enable this function, after excessing the condition below, the idle port will call each other random (need to set the SIM number for every port first).

**Conditions Settings** Collapse

	SMS Content	Operation
<input type="checkbox"/>	please call me!	[Delete] [Edit]
<input type="checkbox"/>	call me right now!	[Delete] [Edit]
<input type="checkbox"/>	plz call me when u're free.	[Delete] [Edit]

Figure 3.4.8-3 SMS List

The callee will select a SMS content first, then send to caller before inter calling, you can click “Add New” button to add new SMS content and delete or edit the SMS content.

### 3.4.9 SIM Num Settings

You should set the SIM number first before enable the inter port calling/SMS-sending. You can get SIM number by USSD or SMS automatically.

The screenshot shows a web-based configuration interface titled "Auto Settings". It contains several input fields and buttons:

- Auto-Get LocNum:** A dropdown menu currently showing "USSD".
- USSD Command:** A text input field containing "\*134\*2#".
- Number Keywords:** A text input field containing "number".
- Prefix Translation:** A text input field containing "930".
- Get Now:** A button next to the USSD Command field.
- Submit/Reset:** Two buttons at the bottom right of the form.
- Help Text:** A blue asterisk note states: "\* The prefix keywords of the SIM number in USSD response." Below this, a dashed arrow points from the "930" in the Prefix Translation field to a text box containing "The prefix to be added".

Figure 3.4.9-1 USSD Auto-Get LocNum Settings

Items	Description
Auto-Get LocNum	When choose USSD, the gateway will get the SIM number by USSD
USSD Command	The USSD command for querying SIM number.
Number Keywords	The prefix keywords of the SIM number in USSD response. For example: the USSD response is your SIM number 923345556978, then keyword is number, it is usually the word before SIM number.
Prefix Translation	If you get the number is 923345556978, but you don't need a country code, you can do prefix translation, delete 923 then add 0.

Table 3.4.9-1

The page below shows the setting of getting number by SMS, it is same as USSD, you should send the SMS content to the operator to get the SIM number.

On this page, you can send USSD command and get USSD response more convenient.

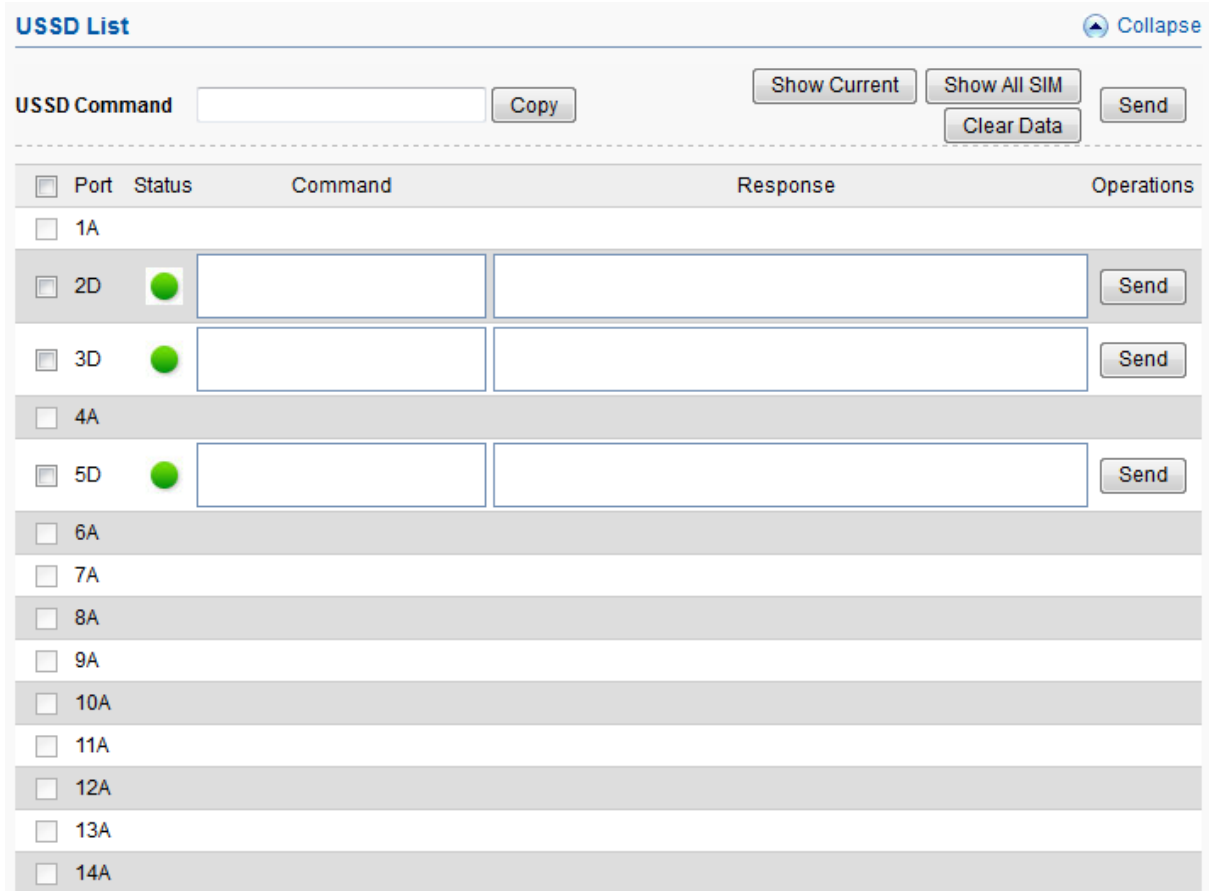

Figure 3.4.11-1 USSD List

Items	Description
Copy	Copy the USSD command to other channel.
Show Current	Display the active SIM cards.
Show ALL SIM	Display all SIM cards.
Clear Data	Clear the USSD response.
Send	Execute the USSD command.

Table 3.4.11-1

### 3.4.12 Billing Settings

This is the billing system page, this billing system is widely used in querying balance automatically which can remind customers to recharge or replace the no balance SIM cards. The theory of this billing system: every SIM card will get an accurate balance from USSD or SMS response, then the system will deduct money in every billing period by tariff which you set, so it may take some deviation.

**Basic Settings** Collapse

Billing:  \* When the balance is not enough.

Hangup The Call:  \* When the balance decrease to warning value, query the balance.

Auto Query Balance:  \* Minutes, get balance periodically. 0 means no query.

Auto Query Balance:

Figure 3.4.12-1 Basic Settings

Items	Description
Billing	Enable it, the billing system will be up.
Hangup The Call	If it is enabled, the call will be hang up when the balance is lower than invalid balance value.
Auto Query Balance	If it is enabled, it will query the balance when lower than caution balance value.
Auto Query Balance	Get balance periodically, it may be more accurate.

Table 3.4.12-1

**Provider List** Collapse

Index	Operator ID	Operator Name	Query Method	Caution Balances	Invalid Balances

					<input type="button" value="Inquiry Now"/> <input type="button" value="Submit"/> <input type="button" value="Reset"/>	

Figure 3.4.12-2 Related Settings

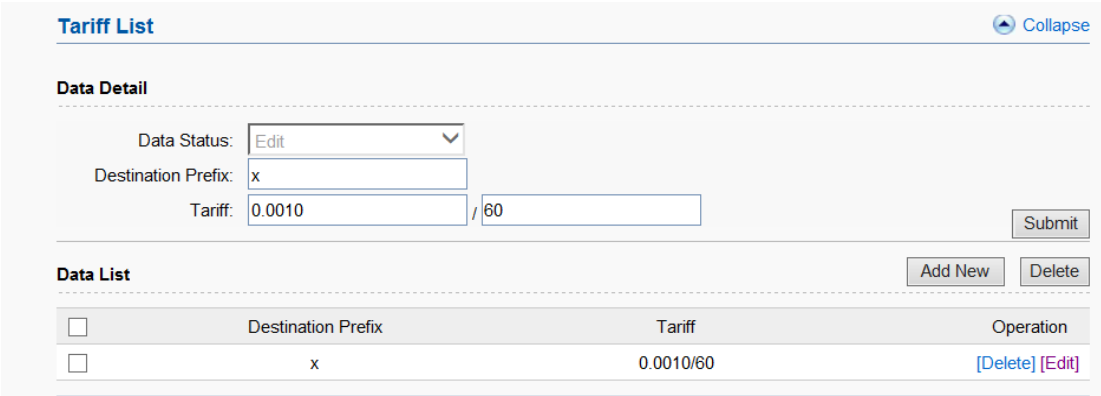

Items	Description
Query Method	USSD or SMS for querying balance
Caution Balances	When the balance is lower than caution balance value, the billing system will send a USSD or SMS to recalibrate balance.
Invalid Balances	The SIM can't be used if it is lower than invalid balance value and it will show  No Balance
Query Command	The HTTP or SMS command for querying balance
Balance Keywords	The balance keywords in USSD or SMS response. For example: your credit balance is AED 45.82. then AED can be the keywords
Invalid Balance Keywords	Can't get balance from invalid balance keywords.
Invalid SIM Keywords	If the SIM is blocked by operator, it may get another response like: sorry, your SIM is blocked now. then you can set blocked as a invalid SIM keywords. The card will show
Service Num	The operator number, it will send SMS back to you.
Query Cmd	SMS command for querying balance
Balance Keys	Same as Balance keywords.
Invalid Bal Keys	Same as USSD.
Invalid SIM Keys	Same as USSD.

Table 3.4.12-2

Click “Add New” button, you can set a tariff list with different destination prefix. ”x ” means for all prefix. You can also do the operations of delete and edit here.

### 3.4.13 Call Dur. Control

Call duration control is for users to control the SIM using time. And the data will not flush even you restart the device or pull off the SIM.

**Call Duration Settings** ▲ Collapse

Use Global Settings:  All Channels use the same call duration control.

Total Max Duration:  Minutes

Daily Max Duration:  Minutes, to use this feature, please *set the NTP server*.

Min Duration Unit:  Seconds

DropCall If Expired:  Drop the call if the MCD expired.

**Figure 3.4.13-1 Call Duration Settings**

Items	Description
Use Global Settings	Enable: all channels use same call duration limitation. Disable: you can set different call duration limitation for single channel.
Total Max Duration	The value of limitation. After the call duration exceeds this value, the SIM will be locked by device. 0 means no limit.
Daily Max Duration	The value of limitation. After the daily call duration exceeds this value, the SIM will be locked by device. 0 means no limit.
Min Duration Unit	Operator charging time, when the call is over this time, operator will collect fees. For example: china mobile charge per minute, the min duration unit will be 60 seconds.
Drop Call If Expired	Enabled: calls will be dropped after the SIM exceeds call duration time. Disabled: calls will not drop.

**Table 3.4.13-1**

You can scan more details about the call duration control on the page below. Once the SIM is used up, it will be locked by gateway. If you still want to use it, you need to click “Reset”.

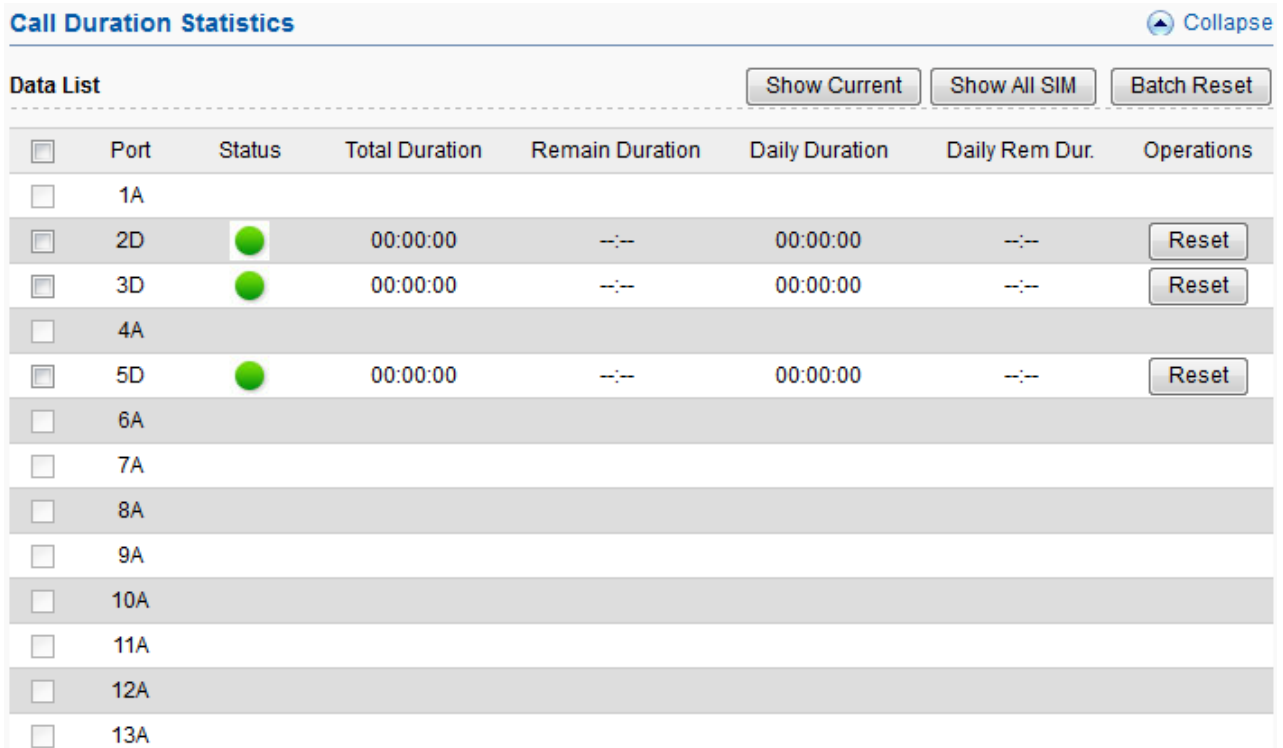

Figure 3.4.13-2 Call Duration Statistics

Items	Description
Total Duration	The value of total duration
Remain Duration	Indicates the current SIM remain time.
Daily Duration	The value of Daily Duration
Daily Rem Dur.	Indicates the current SIM daily remain time
Reset	The call duration will reset to the initial value. (daily cal duration will reset every day)

Table 3.4.13-2

If you need every channel has different call duration (single call duration control), please disable use global settings, and then you will see the page below.

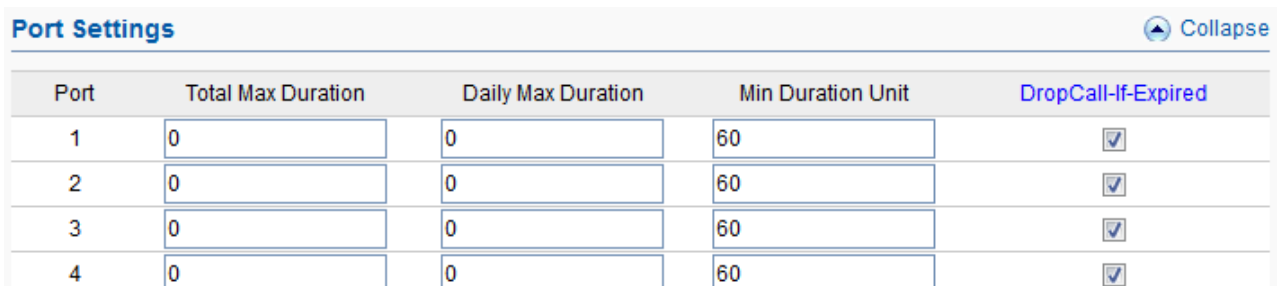

Figure 3.4.13-3 Port Settings

## 3.5 Application Settings

### 3.5.1 Phone Book

When you need other SIP server to send traffic to this gateway, you can add server details in phone book. But make sure it's the point to point mode. Click "Add New" button, setting the server details here. You can also delete and edit phone book list.

The screenshot shows a web interface for managing a phone book. It is divided into two main sections: 'Data Detail' and 'Data List'.

**Data Detail:** This section contains four input fields: 'Data Status' (a dropdown menu set to 'Edit'), 'Remote Gateway ID' (text input 'ejoin'), 'Gateway IP' (text input '119.81.127.122'), and 'Gateway Port' (text input '5060'). A 'Submit' button is located to the right of these fields.

**Data List:** This section features a table with columns for 'Remote Gateway ID', 'Gateway IP', 'Gateway Port', and 'Operation'. There are 'Add New' and 'Delete' buttons above the table. The table contains one entry with the following data:

<input type="checkbox"/>	Remote Gateway ID	Gateway IP	Gateway Port	Operation
<input type="checkbox"/>	ejoin	119.81.127.122	5060	[Delete] [Edit]

Figure 3.5.1-1 Phone Book List

### 3.5.2 Dial Plan

The dial pattern string is a normal regular expression. For example: The pattern 90[1-4] means the dialed number start with 90 and end with anyone of 1/2/3/4. So like the input 901,902,903 or 904 all can be accepted.

The screenshot shows a web interface for 'Dial Pattern Settings'. It includes a 'Pattern List' section and a 'Data Detail' section.

**Pattern List:** This section has a 'Collapse' button (indicated by an upward arrow icon).

**Data Detail:** This section contains two input fields: 'Data Status' (a dropdown menu set to 'Add') and 'Pattern' (an empty text input field). A 'Submit' button is located to the right of these fields.

**Data List:** This section features a table with columns for 'Pattern' and 'Operation'. There are 'Add New' and 'Delete' buttons above the table. The table currently displays 'No Data'.

Figure 3.5.2-1 Dial Pattern Settings

### 3.5.3 Number Translation

Number translation is apply to GSM ->> IP calls.

**Prefix Translation List** Collapse

---

**Data Detail**

Data Status:

Ports:

Original Prefix:  x means all input number, [0-9] means all digits

Translated Prefix:  x means the corresponding digit of original prefix from right to left

---

**Data List**

<input type="checkbox"/>	Ports	Original Prefix	Translated Prefix	Operation
<input type="checkbox"/>		[2-9]	0755x	<a href="#">[Delete]</a> <a href="#">[Edit]</a>

Figure 3.5.3-1 Prefix Translation List

Taking the figure above as an example, calling the SIM in gateway, you will hear an IVR: please dial a number, if you dial 85245166, it will be translated to 075585245166.

### 3.5.4 Incoming Translation

Incoming translation is apply to IP->>GSM calls. When you send traffic to the gateway, you can do the callee number translation here.

**Data Details**

Data Status:

Callee Prefix:  \* Asterisk means match all digits

Digits Stripped:  \* 0 means not stripping prefix

Digits Added:  \* Space means not adding prefix

---

**Data List**

<input type="checkbox"/>	Callee Prefix	Digits Stripped	Digits Added	Operation
<input type="checkbox"/>	2567	3	0	<a href="#">[Delete]</a> <a href="#">[Edit]</a>

Figure 3.5.4-1 Translation List

Taking the figure above as an example, the callee number is 25670123456, it is with prefix 2567, the system will stripped 3 digits, then add 0, the callee number will be translated to 070123456.

### Caller ID Hidden

If you want to hide caller ID, please enable caller ID hidden then input the dial prefix. ( Note: Need operators support with this function.)

**CallerId Hidden** Collapse

CallerId Hidden:

Dial Prefix:

Figure 3.5.4-2 CallerId Hidden

### 3.5.5 Incoming Black List

You can forbid some calls by incoming black list.

**Black List** Collapse

**Data Details**

Data Status:

Callee Prefix:  'x' means all number

Callee Length:  '\*\*' means the callee length is unlimited

**Data List**

<input type="checkbox"/>	Callee Prefix	Callee Length	Operation
<input type="checkbox"/>	016	12	<a href="#">[Delete]</a> <a href="#">[Edit]</a>

Figure 3.5.5-1 Incoming Black List Settings

Taking the figure above as an example, if the callee id like 016xxxx, and the length is 12 digits, these calls will be rejected by the gateway.

### 3.5.6 Incoming White List

Incoming white list is base on black list.

Figure 3.5.6-1 Incoming White List Settings

Taking the figure above as an example, just these number began with 0167 and long 12 digits can through this gateway when you set the “Incoming Black List” like above.

### 3.5.7 SIM Pool Settings

When you want to manage SIM cards remotely or intensively, you can use this function.

Figure 3.5.7-1 SIM Pool Settings

Items	Description
SIM Pool	When you enable it, cards on gateway will be disabled, it can just use these cards on SIM Pool.
Registration	Enable: connect to SIM center. Disable: connect directly to SIM pool.
Server Address	SIM center or SIM pool address.
Username	The GOIP account in SIM center
Password	The password of GOIP account in SIM center.
Status	Show the gateway registration status.
Use Local Policy	If it is enabled, the policy of page lock/switch card can be used in SIM Pool.

Table 3.5.7-1

### 3.5.8 Auto Recharge

Auto recharge is based on billing system, if you want to do auto recharge, please configure billing system first.

**Auto Recharge Settings**

**Basic Settings** Collapse

Auto Recharge:

Server Address:  \* Add ":port" to specify a special port.

Username:

Password:

Status:

---

**Other Settings** Collapse

Min Balance:  \* If balance reached to this value, the auto-recharge will be trigger.

Figure 3.5.8-1 Auto Recharge Settings

Items	Description
Auto Recharge	Auto recharge will work when enable it.
Server Address	The auto recharge server address. (the server with EJOIN ear system)
Username	It is created in EJOIN ear system.
password	It is created in EJOIN ear system.
status	Show the registration status.
Min balance	If the balance is lower than the value, the ear system will do auto recharge.

Figure 3.5.8-1

### 3.5.9 State Notification

With this function, device will send state notification which includes registration status, SIM status and CDR to the server (Ejoin ein system).

Figure 3.5.9-1 Basic Settings

Items	Description
State notification	If it is enabled, device will send state notification to the server.
Server address	The server which can get state notification.(need install EJOIN ein system)
Username	The device account in ein system.
password	The password of account in ein system.
Registration Status	Show the registration status.

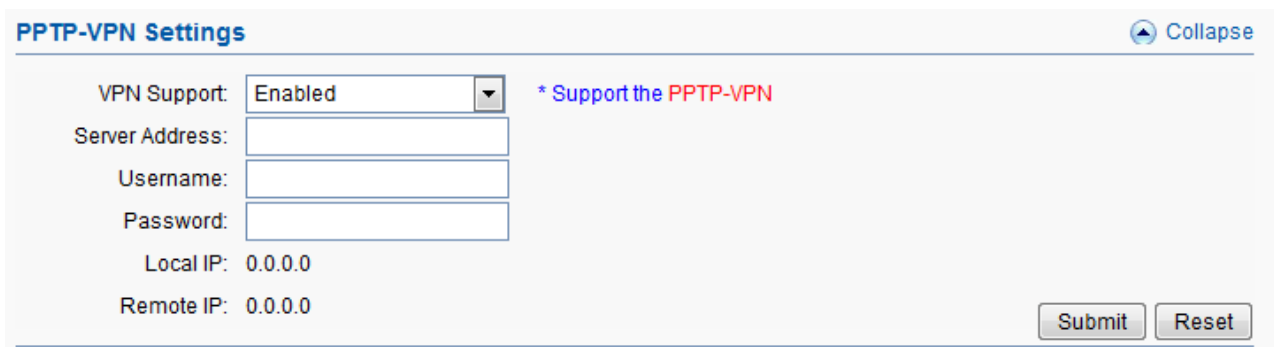

Table 3.5.9-1

## 3.6 Advanced Setting

### 3.6.1 Network settings

#### PPTP-VPN settings

A virtual private network (VPN) extends a private network across a public network, such as the Internet. It enables a computer or network-enabled device to send and receive data across shared or public networks as if it were directly connected to the private network, while benefiting from the functionality, security and management policies of the private network. This device works as VPN(PPTP) client mode only, if you want to use VPN function, please input the VPN parameter on the PPTP-VPN settings page.

**PPTP-VPN Settings** [Collapse](#)

#### Network Settings

There are three ways to access the device: web, telnet and serial. web default port is 80, telnet is 23 and serial is the com port you insert. Web configuration is widely used in this device. If you want to change web and telnet default port, please input new port on this page.

Disable all port

**Figure 3.6.2-1 Port Settings**

Items	Description
Type	Indicates the current type of network GSM/CDMA/WCDMA..
Disable	If it is disabled, this channel will be locked by gateway.
Hot-line	When GSM part client call to this channel, gateway will auto forward to the hot-line (Mobile to VoIP). Leave it blank if you don't need this function.
Unconditional Forward	When GSM part client call to this channel, gateway will forward the call to another mobile unconditionally.
No Answer Forward	When GSM part client calls to this channel, if this channel is no answer, gateway will forward the call to another mobile.
Busy Forward	When GSM part client call to this channel, if this channel is busy, gateway will forward the call to another mobile.

On Duration:       Off Duration:

**Busy Tone**

High Frequency:       Low Frequency:   
On Duration:       Off Duration:

**Figure 3.6.3-1 Voice and Codec Settings**

Items	Description
Voice Volume	The DSP volume. the value range is 10-40. Input volume is on IP side and output volume is on GSM side. You can adjust volume here.
Dial Tone	The dial tone is sent to a customer or operator to indicate that the receiving end is ready to receive dial pulses or DTMF signals. It is used in all types of dial offices when the customer's or operator's dials produce dial pulses. Usually adopt the default settings.
Ringback Tone	The ring back tone(or ringing tone) is an audible indication that can be heard on caller side while the callee side phone is ringing. Normally, it is a repeated tone, designed to assure the caller that the callee side phone is ringing. Usually adopt the default settings.
Busy Tone	The busy tone indicates that the called customer's line has been reached but that it is busy, being wrong, or on permanent signal. When an operator applies a busy signal, it is sometimes called a busy-back tone. Line Busy Tone is a low tone that is on and off every 0.5 second. Usually adopt the default settings.

**Table 3.6.3-1**

## Voice Codec Priority

You can click “Up” or “Down” to adjust the codec priority.

		Submit	Reset

Figure 3.6.6-1 Application Feature

Items	Description
Caller ID Display	If it is disabled, caller ID will not show on “call status” page.
Silence Suppression	If it is enabled, half of the bandwidth will be saved.
Adaptive Jitter Buffer	A jitter buffer is a shared data area where voice packets can be collected, stored, and sent to the voice processor in evenly spaced intervals.
IP TOS	TOS of IP packets.
Don't send # to PSTN	If it is enabled, the last digit # of callee number will be removed.
Append # to PSTN	If it is enabled, # will be appended in the callee number
Carry PSTN Caller ID	SIP extension will show the mobile number when you call the SIM in gateway.
Forbid GSM call	Calls will be rejected when calling the SIM in gateway.
White Number List	The numbers in white list will not be rejected if forbid GSM call is enabled.
DTMF Pre-Act time	The prepare time until DTMF tone is detected.
DTMF Activity time	The minimum of DTMF activity time.
Max Alerting Time	The maximum time of alerting.
Max Ringback Time	The maximum time of ring back.
Max Call Duration	The maximum duration for every call. System will hang up the call automatically if the call duration exceeds this value.
RTP Inactivity Time	The maximum duration of silence from gateway. System will hang up the call automatically if the silence duration exceeds this value
Auto Alerting Time	Fake ring back time, gateway will do fake ring back when exceeds this value.
Stop Pseudo Time	Stopping fake ring back when the callee is alerting.
GSM Auto Answer	Applying to calls from GSM network. The gateway will answer the incoming calls automatically when exceeds the value.
VoIP Call Auto Answer	Applying to calls from IP network. The gateway will answer the calls automatically when exceeds the value.
DTMF Mode	RFC2833, SIP INFO and IN-BAND. The default one is RFC2833.
RFC2833 Payload Type	RTP Payload for DTMF, the default is 101.
RTP Ptime	The interval of RTP packages.
RTP Start Port	The initial port when RTP voice stream transmit the IP network.

### 3.7.2 Device Mgmt

#### Basic Settings

You are allowed to set an alias for device. You can also manage your gateway to reboot automatically as you like. There are two types for you to choose, one is after gateway running specified time, and the other one is scheduled reboot.

**Basic Settings** Collapse

Device Alias:

Auto Reboot:  \* After running specified times(hours)

Scheduled Reboot:

Figure 3.7.2-1 Basic Settings

#### Date and Time

You can choose your time zone or change the NTP server address here.

**Date And Time** Collapse

Time Zone:

Time Server:  \* NTP Server's host or IP address.

Figure 3.7.2-2 Date And Time

## Remote Management System

Remote Management system is used to manage the gateway when it located in other physical locations. Network must be available for the gateway to communicate with ERM Server.

If ERM is enabled and correctly set, the gateway will register to ERM server and set up the connection between itself and ERM server. Administrator can login ERM server and monitor all the registered gateways.

Figure 3.7.2-3 ERMS Settings

Items	Description
Enable ERM	Enable Ejoin remote management system.
ERM Server IP	The ERM server which is installed with Ejoin ERM software.
ERM Server Port	The port of ERM service. Default is 50000
Account	ERM account. You can also click “Register” to create a new account.
Password	Password of ERM account.
status	The Registration status of gateway with ERM server.

Table 3.7.2-1

## 3.7.3 File Management

File management is used for debugging the device. It has gdb, dying message and call statistics files. You can export or delete the logs from this page.

Figure 3.7.3-1 File List

### 3.7.4 Module Update

On this page, you can update the GSM/CDMA/WCDMA module software for every channel.

Module Upgrading <span style="float: right;">Collapse</span>						
<input type="checkbox"/> Port	Type	Version	State	Progress	Description	
<input type="checkbox"/> 01	M10					
<input type="checkbox"/> 02	M10					
<input type="checkbox"/> 03	M10

### 3.7.5 System Update

#### Import File

On this page, you can update the firmware for device, you can also update other files like kernel, ramfs etc.

Import File <span style="float: right;">Collapse</span>	
File Type:	Firmware
File Name:	<input type="text" value="浏览... 未选择文件。"/> <input type="button" value="Submit"/> <input type="button" value="Cancel"/>

Figure 3.7.5-1 Import File

#### Export Configuration

Click “Export” button to export the configuration files.

Export Configuration <span style="float: right;">Collapse</span>	
Click 'Export' button to export the configuration. <input type="button" value="Export"/>	

Figure 3.7.5-2 Export Configuration

## Restore To Factory

Sometimes there is something wrong with your gateway that you don't know how to solve it, mostly you will reset it. Just click "restore" button, your gateway will be reset to the factory settings.(IP will not change) .

Figure 3.7.5-3 Restore To Factory

## 3.8 Debugging Tools

### 3.8.1 Test Network

PING is utility used to test the reachability of a host on IP network and measure the network quality between device to the destination host. There are two types of ping test: one is auto ping, the other one is manual ping.

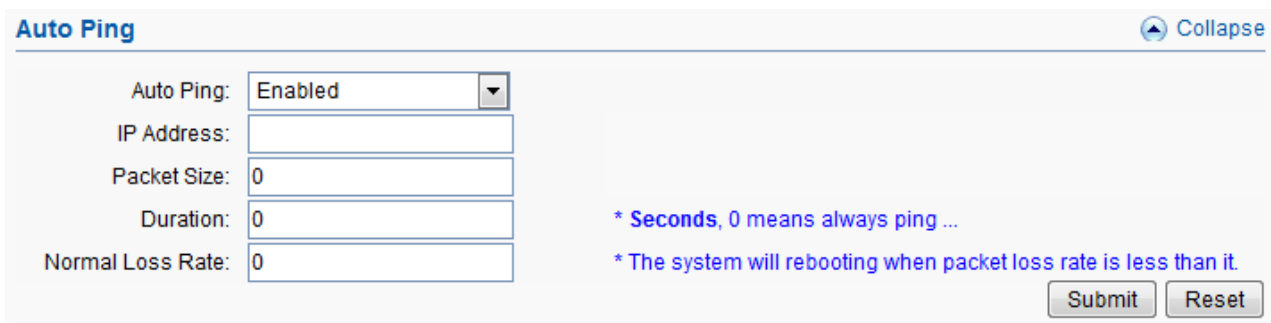

Figure 3.8.1-1 Auto Ping

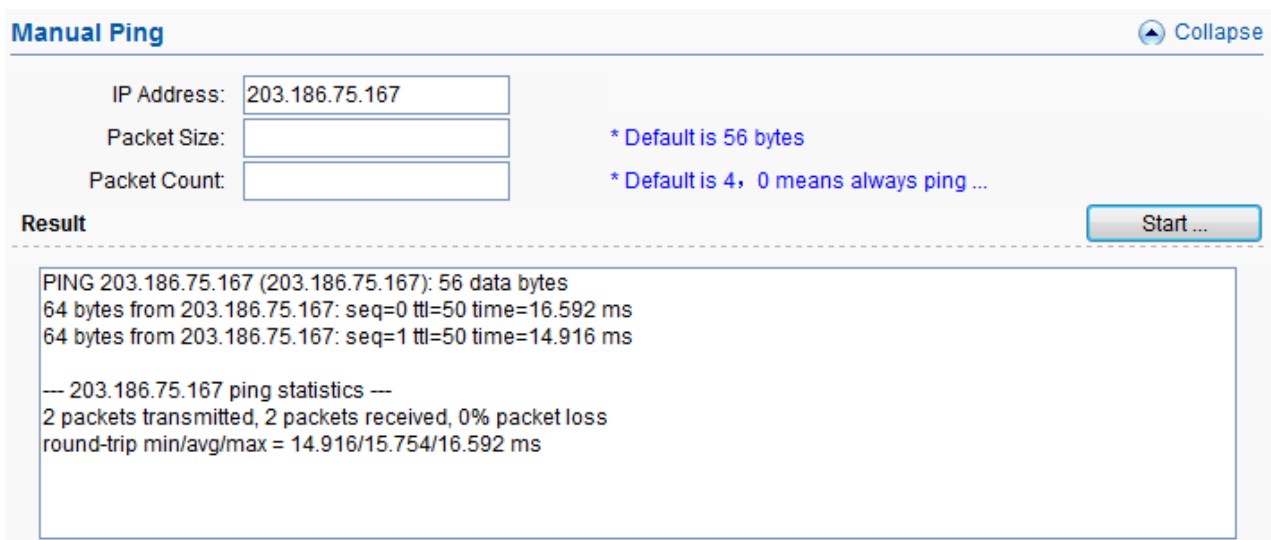

Figure 3.8.1-2 Manual Ping

## 3.8.2 Log System

You can enable the specific progress module running logs to monitor the device working status, and set the log file size. Device will save 5 logs defaultly , 20 is the maximum of logs num that device can saved in memory.

You can back to System Setting>>File management page to download these log files.

**Log File** Collapse

Logfile Count:  \* The size of single logfile is 1MB.

Dying Msg Size:  \* The dying message(dyingmsg.log) size in KB.

6	107	66	45	0	0/25	00:00:05	00:07:55	42%	05:56:32

Figure 3.9.4-1 Call Statistics

Items	Description
Port No.	Number of GSM/CDMA/WCDMA ports.
Calls	The total number of calls that send out from this SIM card.
Alerted	The total calls which is responded alerting message.
Connected	The total answered calls
Consecutive Fails	The consecutive failed calls.
No Carriers	No Carriers times and trying times.
PDD	Post Dial Delay (PDD) is experienced by the originating customer as the time from the sending of the final dialed digit to the point at which they hear ring tone or other in-band information. Where the originating network is required to play an announcement before completing the call then this definition of PDD excludes the duration of such announcements.
ACD	The Average Call Duration(ACD) is calculated by taking the sum of billable seconds(billsec) of answered calls and dividing it by the number of these answered calls.
ASR	Answer Seizure Ratio is a measure of network quality. It's calculated by taking the number of successfully answered calls and dividing by the total number of calls attempted. Since busy signals and other rejections by the called number count as call failures, the ASR value can vary depending on user behavior.

Table 3.9.4-1

### 3.9.5 SMS Statistics

On this page, you can scan the SMS statistics include the total SMS numbers received from wireless network, the total numbers of SMS send out to phone user, the total number of send successfully for every SIM card.
